

NSW Government Incentives for Batteries for Households and Businesses

**Keep the lights on for le\$\$ than ever -
home battery storage just got cheaper**

If you already have solar panels, but find you're still using a lot of grid electricity at night, adding a battery can keep you using your own cheap solar power for longer.

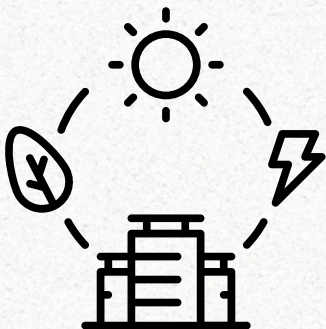

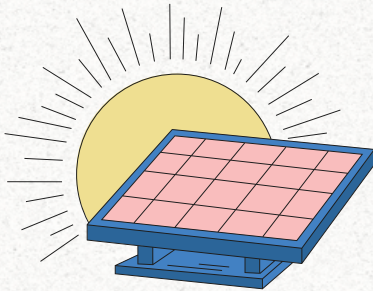

The NSW government wants to keep the cost of electricity down by reducing the demand for power at peak times. To supply power at peak times, the electricity company often has to buy very expensive electricity from gas generators, and they pass that cost on to their customers. So the government is offering an incentive for households to install batteries that will meet their power needs in the evenings and at night. If they will allow their supply to be managed by the electricity company as part of a 'virtual power plant' the savings are even larger.

You could be entitled to:

- between \$1,600 and \$2,400 off the up-front installation cost of a household battery for homes and business with existing solar
- for homes and businesses wanting to install solar, the incentive will be considered in the quote for a new solar and battery system installation
- a \$250 to \$400 incentive for connecting a battery to a Virtual Power Plant. It can be claimed a second time, 3 years on.
